DS 644: Homework 1 ANSWERS

Instructions. Answer the following multiple choice questions by selecting the correct choices.

1.	Pro	ogramming Paradigms
	(a)	Which of the following is not an example of a programming paradigm?
		$\sqrt{\ JavaScript}$ \square Declarative \square Imperative \square Functional \square Object-oriented
	(b)	Which of the following characteristics are typical of imperative programs.
		\square values of variables may change or "mutate" (they are $mutable$)
		$\hfill\Box$ program execution proceeds by carrying out a sequence of instructions
		\Box functions often have $side$ -effects
		$\sqrt{\ all\ of\ the\ above}$
	(c)	Which of the following characteristics are typical of functional programs.
		\Box values of variables do not change or "mutate" (they are $immutable$)
		☐ functions are referentially transparent
		☐ functions do not have side-effects
		$\sqrt{\ all\ of\ the\ above}$
2.	A h	igher-order function is a function that
		\Box can be passed as an argument to other functions
		\Box can be returned as output by other functions
		□ can be called a higher order of times than ordinary, "lower-order" functions
		$\sqrt{\ accepts\ a\ function\ (or\ functions)}\ as\ input\ or\ returns\ a\ function\ (or\ functions)\ as\ output.$
		$\hfill\Box$ takes a higher order of magnitude of time to return a value than ordinary, "lower-order" functions
3.	An	expression e is called referentially transparent provided
		☐ the value of e, when it is reduced to "normal form," is obvious or "transparent."
		☐ the values all expressions to which e refers are obvious or "transparent."
		$\sqrt{\ }$ for all programs p, all occurrences of e in p can be replaced by the result of evaluating e without affecting the meaning of p.
		\Box none of the above
		8

4.	Intr	roduction to Scala, Part I
	(a)	The programming paradigm(s) of Scala is(are) which of these? (select all that apply).
		\square assembly \square declarative \square imperative $\sqrt{functional}$ $\sqrt{object\text{-}oriented}$
	(b)	What is the result of the following program?
	()	val x = 0
		def f(y: Int) = y + 1
		<pre>val result = {</pre>
		val x = f(3)
		x * x
		} + x
		\square 0 $\sqrt{16}$ \square 32 \square it does not terminate
	(c)	Why should we care about writing functions that are "tail-recursive?"
	(-)	□ Recursion should be carried out on the tail, not the head.
		□ Recursion should be carried out on the head, not the tail.
		$\sqrt{Non-tail-recursive\ functions\ may\ exhaust\ stack\ memory.}$
		•
		□ Non-tail-recursive functions may exhaust heap memory.
5.	Con	sider the following code.
		<pre>def sq(x: Double): Option[Double] =</pre>
		if (x < 0) None
		else Some(Math.sqrt(x))
		val list = List(-1.0, 4.0, 9.0)
	(a)	To what does the expression list.map(sq) evaluate?
		☐ List(2.0, 3.0)
		$\sqrt{\ List(exttt{None, Some}(2.0),\ exttt{Some}(3.0))}$
		□ Some(List(2,0, 3.0))
		□ None
		\Box none of the above
	(b)	To what does the expression list.flatMap(sq) evaluate?
	. ,	\(\langle List(2.0 3.0)

6.	, –	points) Introduction to Scala, Part II. The parts below refer to the function $test(x:Int = x * x)$.
	(a)	For the function call test(2, 3), which evaluation strategy is most efficient (takes the least number of steps)?
		□ call-by-value is more efficient
		□ call-by-name is more efficient
		$\sqrt{\ call ext{-}by ext{-}value}\ and\ call ext{-}by ext{-}name\ require\ the\ same\ number\ of\ steps}$
		☐ the program does not terminate
		Explanation.
		In both cases we have to do one multiplication (2 * 2).
	(b)	For the function call test(3 + 4, 8), which evaluation strategy is most efficient?
		$\sqrt{\ call ext{-}by ext{-}value\ is\ more\ efficient}$
		\Box call-by-name is more efficient
		\Box call-by-value and call-by-name require the same number of steps
		☐ the program does not terminate
		Explanation.
		Call-by-value performs one addition $(3 + 4)$ and one multiplication $(7 * 7)$, whereas call-by-
		name performs two additions and one multiplication $((3 + 4) * (3 + 4))$.
	(c)	For the function call test(7, 2*4), which evaluation strategy is most efficient?
		□ call-by-value is more efficient ✓
		$\sqrt{\ call ext{-}by ext{-}name\ is\ more\ efficient}$
		□ call-by-value and call-by-name require the same number of steps
		☐ the program does not terminate
		Explanation.
		Call-by-value performs two multiplications (2 * 4 and 7 * 7), whereas call-by-name performs just one multiplication (7 * 7).
	(d)	For the function call test(3+4, 2*4) which evaluation strategy is most efficient?
	. ,	□ call-by-value is more efficient
		□ call-by-name is more efficient
		$\sqrt{\ call-by-value\ and\ call-by-name\ require\ the\ same\ number\ of\ steps}$
		☐ the program does not terminate
		Explanation.
		Call-by-value performs one addition $(3 + 4)$ and two multiplications $(2 * 4)$ and $(3 * 7)$, and
		call-by-name performs two additions and one multiplication $((3 + 4) * (3 + 4))$.
